KANSAS TO THE FRONT

With a last and Improved Train Service to Kan-bis City, St. Liout., Chicago and the World's Fair.

Commencing Sunday, May 14th, the Missouri Pacific railway placed in operation in addition to its present service, an excellent through train between points in Southern Kansas and Kansas City, St. Louis, Chicago any the Worla's fair. The new train, No. 462, leaves Anthony daily at 050 n. m.; Wichita, 9:00 n. m.; El Dorado, 10 n. m.; Yates Centre. 12:30 p. m., arriving at Kansas City at 5:45 p. m., making direct connections with fast Missouri Pacific trains to St. Louis, and with all lines to Chicago.

This is probably the most satisfactory This is probably the most satisfactory and serviceable schedule ever placed into effect between points in Southern Kansas and the north and cast, and places the state of Kansas on an equal footing with other states in the matter of fast trains to the World's Fair city. An elegant equipment is used in the make up of this special and everything is looked after that will add to the comfort of the passengers. For further information in regard to rates, routes, maps, time tables, etc., address nearest Missouri Pacific railway ticket agent, or H. C. Townsend, general passenger and ticket agent, St. Louis, Mo., or E. E. Bleckley, P. & T. A. Wichita, Kan. Telephone 211, H4 North Main street, di54 tf

SAFETY IN A FAST STEAMER. Such Vessels as the Campania Must of Necessity Be Strong.

A ship that can make a voyage to New York and back in a fortnight will earn fifty-two freights in the year, instead of twenty-six of the boats of twenty years ago, says the Saturday Review. The crew costs no more, if the coal does, and the earnings are double. But there is yet another view of the matter. The late Sir William Pearce, who began these fast boats by the building of the Arizona, and whose cessors at Fairfield have built the Campania, once asked a friend, whose imagination recled at the idea of a twenty-two knot boat, whether he boat in preference to meeting an ignominous death in an ocean tramp. The humor of the sentiment lies in the fact that it is the ocean tramp that always goes down in the case of a collision, and it is the fast boat that sends the tramp down. Parliamentary humanitarians should see to this. Surely their reckless ingenuity is equal to the discovery of some way of preventing people from choosing their mode of drowning. Those who know most about boats know that the safe boat is must of necessity be strong. The fast and strong boat never waits for the waves to hustle and buffet it; it goes through them. Once in awhile, it is true, an equinox may contrive a gale that will trouble even the Campania, but a wave requires time to gather itself together and spend its strength, and a fast boat of the right build does not wait. There are, of course, fast fair-weather boats, designed to make "record" passages in sunshine, which do so, but which flounder in the trough of the sea when the waves roll high.

sisted by His Skillful Young Wife.

Duke Carl Theodor, of Bavaria, is a most charitable man and an extremely for persons suffering from disease of the eyes-one at Meran, one on the Tegernsee, where he passes most of his time, and one at Munich. makes no charge for poor patients, but at the door there is a box into which those who can afford it are expected No. 43, Prote and Kingman accom-no. 43, Prote and Kingman accom-to place contributes. The duke, who is a general in the Bavarian army, was born in 1839, and is a brother of the empress of Austria. In 1874 he married as his second wife Princess Maria Josepha, of Braganza, who assists him in his charitable work. His eldest daughter by the second marriage is Duchess Sophie, who was born in The Missouri Pacific railway is now sell. February, 1875. She has inherited her ng tickets to Chicago and return for \$25.0-Good to return Nov. 15, 1895. St. Louis sistant in his work as an oculist. The February, 1875. She has inherited her duke always enters his consulting room by seven o'clock in the morning, and the young duchess takes her share in soothing the sufferers and enters with enthusiasm into the charitable work. As an example of the duke's skill the San Francisco Chronicle mentions that he recently removed a splinter of iron from the eye of an iron turner, an operation which had defled the skill of several other oculists. The duke is the heir presumptive to the throne of the palatinate of Bavaria as man, and, being a practical publisher his elder brother, Ludwig, who married a commoner, has renounced his right.

Cures Piles, Fis-tula, Fissure and The Sense of Vision Superseded by That of Touch.

mething About the Invention of Embossed Printing - The First English Book in English Raised Letters-The "Point" System of To-Day.

[Special Letter.] In this nineteenth century, that teems with the visible evidences of wonderful progress in all the arts and sciences, when the products of the best genius and civilization of the world will be exhibited at the great Columbian exposition, the grandeur and ornate magnificence of which the brightest human eye is inadequate to perceive, it is pitiful to contemplate fact that there are thousands of human beings who are bereft of the priceless boon of seeing and must be content with the mental transports that come through communion with those who are permitted to see this revelation of the centuries. The sun of nature never shines for them. They are in perpetual darkness. They go in and out and hold communication, with varied forms and invisible speech, by the way of the velvet road of feeling or along the sounding strand of hearing, but the crystal gates are closed. With the eyes of the understanding they come down to the avenues of en-

The genins of man has been slow to grapple with the problem of devising practical methods for the successful

trance into the world of light, but

there they stand and wait and feel and

instruction of the blind. Manifestly the first consideration in devising a scheme that will enable the blind to acquire knowledge is the contrivance of a system of printing and writing that will enable them to read and write without the sense of sight. The sense of vision is a pre-requisite to an adequate conception of the nature and relationship of our environments. It is the sense most frequently brought into requisition by the human mind, and contributes more largely

than any other to our happiness. A close study of the natural laws that govern the operation of the perceptive faculties will reveal the fact that the loss of this important sense of sight sharpens and accelerates the mental

processes to a phenomenal degree. Bereft of the sense of vision the human mind is forced to depend upon that other most important function, closely allied to it in our physiological economy, the sense of touch. It is a beautiful and provident dispensation of the all-wise Father that the sense of touch in his slightest children should have been endowed with susceptibilities of a high order. To the person that is born blind the idea of something external to ourselves rests almost entirely upon the sense of touch. The sent of this sense is the outaneous surface of the body, which consists of concentric rows of small, conical elevations known as papillae, in which the nerve fibers terminate, and which, when developed to a condition of acute sensibility, transmit to the brain the nature of the object with which they come in contact with the certainty and velocity of the electric current. On the paimer surface of the hand, particularly at the tips of the fingers, these papillae are more sensitive than at any other point on the surface of the body, except at

the tip of the tongue. It was a natural sequence of these facts that the earliest efforts of the educators of the blind were directed toward the invention of a system of raised, or embossed, letters, that would enable the blind to read easily and

quickly by the sense of touch. The earliest recorded instances of reading by the sense of touch are found in the history of some South American tribes who read by a system of strings tied with numerous knots of different sizes and at various distances apart, all of which had some alphabetical significance. When the Spaniards invaded Peru they found these masses of woolen strings and knots securely stored away in substantially-

constructed boxes. Instructors of the blind who have made a study of the advancement made in systems of printing and writing are pretty generally united in according to the French people the honor of being foremost in the work of embossed printing. The ingenious French had brought this art to a remarkable degree of perfection almost a half century before work of this kind was done in England and at least a quarter of a century before any was done in Ger-The French schools for the blind are the oldest and among the best in the world.

The growth and gradual perfection of a successful system of embossed printing and writing precipitated a never-ending controversy in regard to the relative merits of various alphabets. Naturally the first thought was to construct a series of raised letters that should be similar in form to the letters of the English alphabet but with certain modifications that should simplify them and adapt them more

readily to the sense of touch. A brief reference to a few of the more important efforts in the line of embossed alphabets will suffice for the purposes of this paper. The honor of doing the first embossed printing is usually ascribed to Valentine Haney, founder of the first school for the blind

abcdefghijklmno pqrstuuxyz

HANEY'S PARISIAN TYPE.

in the world at Paris. In 1874. The date of his successful work in embossed printing is that of 1784. For the printing of embossed characters he made a number of wooden types which he looked in a wooden frame and from which he printed a small work entitled "Essai sur l'education des Avengles. The publication of the book excited much wonder and interest, and it was subsequently translated into English

by Haney was Roman Italia. The distinction of having printed the first book in English raised letters is generally accredited to Mr. James Gall, of Edinburg, who performed this feat in 1827. Mr. Gall had seen specimens of printing in French and Gerand printer, he at once devoted himself to the task of devising a series of raised letters that would in his judgment be better adapted to the uses of both the children and the adult blind. He also cherished the ambition to simplify the work of printing for the blind so that it could be done in any

HOW THE BLIND READ, printing office. It was conceded that his type was an improvement over the Parisian system; nevertheless there 40(defekijKIMA09d

TSTVVWXYZ

were many blind persons who could not read it all, and it was evident from the start that type that was destined to become universal must be more tangible, and this led to the construction of the serrated type, which were made of a series of points or punctures arranged in the form of letters; and thus was laid the foundation of the "point system." which has proved to such an inestimable boon to the

Among the early workers in America the name of Samuel G. Howe stands preeminently first. His services in behalf of the blind in this country have been of inestimable value. His name is inseparably linked with the education of the blind, and to him modern educators of the blind ascribe great honor. From the time of his return from Greece in 1832 to his death in 1876 he was indefatigable and unrelenting in his studious and painstaking devotion to the cause of the sightless unfortunates. After a tour among the best institutions for the blind in Europe he began in 1834 to print books

HOWE'S LOWER CASE LETTERS.

this country, the "Boston type." the invention of this type Mr. Howe ignored capital letters and devised a system of slightly modified lower case letters. These various systems of line type.

however, have become obsolete in nearly all the leading institutions of the world, the "point system" having superseded it because of its more perfect adaptation to the sense of touch and by reason of its easy adjustability to all forms of writing, including musical notation and the expression of mathematical calculations. There are two forms of "point" systems now in general use, the "Braille" and the "New York point." Between the advocates of these systems there has been constant and at times bitter contention. It is not the purpose of this paper to enter into this controversy or to discuss in any way the relative mer its of the two systems. Suffice it to say that there appears at this time to be a preponderance of "evidence" in favor of the Braille system, although it is a fact that for the past twelve years most of the embossed printing done in this country has been done by the American printing house for the blind, at Louisville, which receives an annual subsidy of \$10,000 from conpoint." It is a fact, however, that a barber at ourse. Address James H. Mason. of the educators of Wellington, Man. Wellington, Man. gress and which uses the "New York the blind in our leading state institutions express a decided preference for the Braille and emphasize their prefer ence by teaching it almost exclusively. Nevertheless it must be candidly admitted that the "New York point" has many enthusiastic adherents who cling to it with a tenacity born of the con viction that it is the more practical

system. To enable those who read by the sense of sight to form their own ideas of the relative merits of the two systems I give below the alphabet used for general literary work by each sys-

tem: . : T-1. 27 511 21. II TOO TRACT

BRAILLE LITERARY SYSTEM. *** * * * * * # # # " L " - F

A. " NEW YORK POINT.

The Braille system takes its name from its inventor, Louis Braille, a blind teacher in the school at Paris. He was not the inventer of a point system, however. Charles Barbier, an officer in the French army, devised the first point system. The cell, as we term it, contained twelve points, in two rows of six each. The letters being six dors long, the finger could not cover them all at a single touch. No practical use was ever made of the system, but it gave the talented Braille the idea upon which he founded the system that bears his name, and

I Reary to Turker cannot of said bath, do solemnly away but he above statement a true to best of my knowledge and beind for help me foot. RESET C. TUCKER Country.

An interesting announcement is made in the French papers of the discovery of a process for metallizing tex-tile fabrics, by which, it is claimed, the latter are rendered proof against the attacks of innects. The materials, such as wool, flaunch, callen etc., are for this purpose immersed in a boill bath composed of two and one-half pounds of sulphate of copper, one pound of sulpharic acid and sixty-two gailons of water, the fabric being culendered and dried after its removal from the fluid. The finish obtained by this process will, it is said, bear two or three washings before it is again neeessure to subject the cloth to a repeti-
